chemical rather than electrical. 003 then reported the following on each individual area of the site (as per the requirements):

Area A: consists of a large, voluminous structure perceived from the inside with levels (railings, walkways) at intervals up the wall. The structure is full of loud, ~~echoey~~ sounds, and industrial equipment, including lifting devices like traveling cranes. On the floor are large, roughly cylindrical objects with lots of wire windings. These are heavy duty components for even larger devices. The objects are large, bulky, metallic, and will be moved from their horizontal position to a vertical one to be fit into place.

Area B: is empty, light blue, low, dim, empty, with seats and furniture. It is needed from time to time for various purposes. It involves congenial lighting, and has a curving, doming ceiling. There is a pleasant, relaxed atmosphere here that is reminiscent of a meeting place or a conference area.

Area D: has dimensional components involving rounded, aligned uniformly-shaped structures that are curving, smooth, and cold to the touch. They are surrounded by a fence-like structure, and nearby are several lattice-like elements. "Electrical," "high tension," "reinforced," and "heavy-duty" are concepts associated with this portion of the site. There is an impression of transformers on rails and large ceramic insulators. Also an extremely cold liquid--perhaps a liquified noble or inert gas--is present.

Area E: involves in at least one portion a large, long, rectangular, several-floored structure with windows that look out onto a fenced yard with large metal cable spools, and large, massive steel sections stored there. Inside the structure is an electro-mechanical shop. Electrical devices are rebuilt, repaired, or in some cases even fabricated. Windings, copper wire and cable are present. Impression of heavy industry or physical plant here. But other, more intricate work is also performed here on upper levels in smaller rooms. The idea or sense of consolidation of similar activities in one location for efficiency. Impression of a man bent over a work bench with electronic components jumbled up in front of him. Coils, functioning, fields, heavily magnetic, thermocouples, revolving armatures, varying humming and large scale sounds are all involved here.

3. (S/NF/SK) 018 reported that the purpose for this complex is research, manufacturing and storage. The manufacturing is for the government, for foreign governments and foreign companies. The products are of more of a scientific nature than a industrial one. The most important product is considered a rectangular grey package that has the word "explosive" associated with it.

Enclosed as Tab B is an overhead photo on which 018 labeled the purpose of particular buildings. In addition, he reported the following about each individual area:

Area A: includes buildings which have the following functions: storage, procurement, supply and some manufacturing. One particular building contains large, bulky manufactured items (pipes, etc.)

Area B: One of the buildings in area B is in an enclosed work area. Activity in this area is in the form of trucks, hand trucks, dollies, etc. (people carrying goods to and from this building). Some of this traffic comes in from outside or goes to the outside, but most of it is between the buildings, themselves. The purpose of this building is as a procurement/supply/storage facility for goods destined specifically to tactical field units.

Materiel comes into this building from manufacturers (new) and other line units (used). There is a "loading dock/reception counter" area completely inside this building. Here, goods are processed into and out of the building. One of the dollies has the following equipment on it:

- 1) Several cardboard boxes (NFI).
  - 2) A piece of test equipment, slightly larger than a power drill, with the same general shape. It is grayish brown in color, with a shiny band around the front end. The back end of it is recessed and has throw-switches and some indicator lights.
  - 3) A piece of electronic equipment which is an RF receiver, rack mounted, multi-plug, with indicator lights and a meter. This equipment is not a piece which would be considered an "end-item" (that is, the piece the operator normally works with), but acts as a processor of some sort before the signal gets to the operator.
- There is a caged-in area centrally located in the building. This area is approximately 15' square, and goes from floor to ceiling. The contents of this area are hidden from sight by large curtains inside the wire cage. Inside are stacks of equipment. Each piece of equipment is wrapped in black plastic, and not labeled. The equipment consists of metal cases encased in tar, with only plugs for input and output. The plugs are for coaxial cable connectors. There are no knobs, lights, indicators, dials, or anything else on the outside besides the two plugs. The components inside the metal cases are also encased in tar. 3 sizes of equipment are present. The equipment is normally measured metrically, but the approximate sizes in inches are a 2 1/2" cube, 2" high X 6" wide X 9" long and 4" high X 13" wide X 18" long. The equipment is some type of radio equipment which is used "in-line" and is intentionally physically hidden, below dash boards of vehicles, panels of stationary equipment, etc.

AREA C: is a site maintenance area with heating, repair, maintenance, etc. One building in this area has the concept of "nuclear" associated with it.

AREA D: contains administrative buildings and some guest/living quarters. One building is a grey, three story structure which houses the office of the Director of the "working areas" of the complex. The director's name sounds like "Sergey Dolonov" (1st syllable accented). Other than his building, Area D is not under his control, but the majority of areas A, B, C and E are.

Area E: is a complex of buildings, a portion of which are fenced in and separate from the rest of the complex, but still a

part it. One building is for research and testing; another is for personnel. The following data involves only buildings within the fencing. One building is dedicated to paperwork and has the feel of "money" about it. Another building is for storage and has area inside which is extremely cold. A worker is working outside one building, carrying goods from one place to another. These goods are pallets of powdery material which is somehow related to an O.D. colored missile. In one part of Area E there is a male who is placing patches on plant workers' arms, and smearing an amount of strong irritant on the skin under the patch. The strong irritant was perceived as a strong concentration of the same irritant with which the workers come into contact in their daily work. In addition, injections are also given, but these are not related to the skin patch and are for a different purpose. The plant personnel who receive the patch or the injections appear to have no choice about being involved it.

4. Viewer 095 reported that the target is a facility which engages in projects that involve manufacturing and assembly on a small-scale of specialty military items which are components as opposed to entire weapon systems. The manufacture involves precision machining. One of the items which is manufactured is a 15-18 feet long torpedo-shaped object that is big and heavy. It has a silvery-brassy color with a matte finish that is the result of a series of very fine grooves (like screw threads). 095 also reported that:

Area A: includes a long building. Inside the long building is a long narrow hall with many small rooms along it. There are wood desks and casually dressed, educated people and scientists. In another part of area A is another building which has a open, high room 30 x 40 feet and 12 ft high. The room is a machine shop with several work stations. Lots of grinding and drilling noises and sounds like metal being cut. The floor is polished cement.

Area B: In one place three large pipe-like things are laying horizontally interconnected into kind of in a triangular shape. There are also rows/stacks of these pipe-like things.

Area C: Construction/assembly of things is the ordinary, day-to-day routine in area C. The people who work here are blue-collar and where hard hats. There is a moving belt, 'like' an assembly line with large metal components on it. There are lots of banging, clanking and hammering sounds.

Area D: is a fenced-in area with several structures, two of which have a narrow alley between them. General impression is that these structures are somewhat older than those in other areas. Associated with the structures are the idea of storage and of a 'loading' area. Men are stacking long cylindrical objects onto a flat bed truck. This area is very secure, but these workers could care less about security. The cylinders are approximately 2 1/2 feet diameter and 10-15 feet long. A sketch of the back end of one of the cylinders is shown at TAB D. The cylinders are very smooth and are a brownish-brassy matte color. Associated with the cylinders is the concept "encased."

Area E: has several long buildings which are redundant in function: the same routine job is performed in each. Also in Area E is an underground area which is shielded and is accessed by means of stairs which are in a building. There are some office rooms in the underground part, but they are not relevant to the importance of the underground area. The underground room is long and narrow and has lots of pipes in it. The pipes are not connected to anything outside the shielded area but are self-contained. This underground area is very much like a bomb shelter.
